HTML DOM

When a web page is loaded, the browser creates a **D**ocument **O**bject **M**odel of the page.

In other words: **The HTML DOM is a standard for how to get, change, add, or delete HTML elements.**

When an HTML document is loaded into a web browser, it becomes a **document object**.

In the HTML DOM (Document Object Model), everything is a **node**:

- The document itself is a document node
- All HTML elements are element nodes
- All HTML attributes are attribute nodes
- Text inside HTML elements are text nodes
- Comments are comment nodes

Tip: The document is a part of the Window object and can be accessed as window.document.

A **property** is a value that you can get or set (like changing the content of an HTML element).

A **method** is an action you can do (like add or deleting an HTML element).

DOM Element Object

Finding HTML Elements

By ID

```
document.getElementById("intro");
```

By Tag Name

```
document.getElementsById("p");
```

By Class Name

```
document.getElementsByClassName("intro");
```

By CSS selectors

```
document.querySelector(".example").style.backgroundColor = "red";
```

Note: The querySelector() method only returns the first element that matches the specified selectors. To return all the matches, use the querySelectorAll() method instead.

```
var x = document.querySelectorAll(".example");
    x[0].style.backgroundColor = "red";
```

Note: Index position is must

```
Set background color for all p elements
var x = document.querySelectorAll("p");
    var i;
    for (i = 0; i < x.length; i++) {
        x[i].style.backgroundColor = "red";
```

Different ways to use queryselector

```
document.querySelectorAll("div > p");
document.querySelectorAll("h2, div, span");
```

Note: There are two ways to access a node at the specified index in a node list:

```
document.body.childNodes.item(0);    // The first child node of <body>
document.body.childNodes[0];         // The first child node of <body>
```

Useful examples:

```
<div id="myDIV">
  <p>First p element in div.</p>
  <p>Another p element in div.</p>
  <p>A third p element in div.</p>
</div>
```

Ex1:

```
var div = document.getElementById("myDIV");
div.getElementsByTagName("P")[0].innerHTML = "Paragraph changed";
```

Ex2:

```
var div = document.getElementById("myDIV");
var nodelist = div.getElementsByClassName("child");
```

```
var i;
for (i = 0; i < nodelist.length; i++) {
    nodelist[i].style.backgroundColor = "red";
}
```

Changing HTML Elements

1. element.innerHTML

Return:

```
var x = document.getElementById("myP").innerHTML;
    document.getElementById("demo").innerHTML = x;
```

Set

```
document.getElementById("myP").innerHTML = "Hello Dolly.";
```

other ex:

```
document.getElementById("myAnchor").innerHTML = "W3Schools";
document.getElementById("myAnchor").href =
"https://www.w3schools.com";
    document.getElementById("myAnchor").target = "_blank";
```

2. *element.attribute = new value*

Ex1: It wil change the id

```
var x = document.getElementById('DIV1').id = "div2";
var x = document.getElementById('DIV1').src = "home.jpg"; //
it will replace current image to home
```

3.element.style.*property = new style*

ex1:

```
document.getElementById("myH1").style.color = "red";
```

ex2: Multiple properties

```
document.getElementById("myP").style.cssText = "background-
color:pink;font-size:55px;border:2px dashed green;color:white;"

var x = document.getElementsByTagName('H2')[0];
x.setAttribute("style", "color:red;font-sixe:18px;");
```

Other examples:

For getting inline styelesheet

```
var x = document.getElementsByTagName("STYLE")[0];
    document.getElementById("demo").innerHTML = x.innerHTML;
```

```
document.getElementById("More  Text").setAttribute("style",  "font-size:50px;color:red;");
```

Attributes

```
var x = document.getElementById("myBtn").attributes.length;
var x = document.getElementById("myBtn").attributes[1].name; //Prints name
var x = document.getElementById("myBtn").attributes[1].value; //
Prints value
```

getAttribute

element.getAttribute(*attributename*)

```
var x = document.getElementsByTagName("H1")[0].getAttribute("class");
//returs class name of h1
var x = document.getElementById("myAnchor").getAttribute("target");
//returs _blank
```

createAttribute

```
var h1 = document.getElementsByTagName("H1")[0];    // Get the first <h1>
element in the document
var att = document.createAttribute("class");        // Create a "class"
attribute
att.value = "democlass";                            // Set the value of the
class attribute
h1.setAttributeNode(att);                           // Add the class
attribute to <h1>
```

The setAttributeNode() method adds the specified attribute node to an element.

Tip: Use the removeAttributeNode() method to remove an attribute node from an element.

removeAttribute

```
ex1: document.getElementsByTagName("H1")[0].removeAttribute("class");
```

```
ex2: document.getElementById("myAnchor").removeAttribute("href");
```

setAttribute

```
ex1:
document.getElementById("myAnchor").setAttribute("href", "https://www.w3schools.com");
```

```
ex2:
document.getElementsByTagName("H1")[0].setAttribute("class", "democlass");
```

```
ex3: document.getElementById("More  Text").setAttribute("style", "font-size:50px;color:red;");
```

Note:

1. **Tip:** Use setAttribute() to add a new attribute or change the value of an existing attribute on an element.
2. The hasAttribute() method returns true if the specified attribute exists, otherwise it returns false.

Adding and Deleting Elements

CreateElement();

removeChild();

appendChild();

replaceChild();

```
var btn = document.createElement("BUTTON");        // Create a <button> element
var t = document.createTextNode("CLICK ME");       // Create a text node
btn.appendChild(t);                                // Append the text to <button>
document.body.appendChild(btn);                    // Append <button> to <body>
```

or

```
document.getElementById("myDIV").appendChild(para);
```

Tip: Use the createTextNode() method to create a text node.

Tip: After the element is created, use the *element*.appendChild() or *element*.insertBefore() method to insert it to the document.

node.insertBefore(*newnode, existingnode*)

removeChild()

ex1: <ul id="myList">
Coffee
Tea
Milk

```
var list = document.getElementById("myList");

list.removeChild(list.childNodes[0]); //remove ul firstchild node(index 0)
```

appendChild()

```
EX1: var node = document.createElement("LI");
    var textnode = document.createTextNode("Water");
    node.appendChild(textnode);
    document.getElementById("myList").appendChild(node);

EX2: var node = document.getElementById("myList2").lastChild;
    document.getElementById("myList1").appendChild(node);
```

replaceChild()

node.replaceChild(*newnode, oldnode*)

ex1: <ul id="myList">
Coffee
Tea
Milk

```
var textnode = document.createTextNode("Water");
    var item = document.getElementById("myList").childNodes[0];
    item.replaceChild(textnode, item.childNodes[0]);
```

firstChild()&lastChild()

ex1: <ul id="myList">
Coffee
Tea

```
var list = document.getElementById("myList").firstChild.innerHTML;
    document.getElementById("demo").innerHTML = list;//coffee
```

ex2:

```
<select id="mySelect"
size="4"><option>Audi</option><option>BMW</option><option>Saab</option><op
tion>Volvo</option></select>

function myFunction() {

    var x = document.getElementById("mySelect").firstChild.text;

    document.getElementById("demo").innerHTML = x; // Audi

}
```
